

FOUNDATIONS AND APPLICATIONS OF AI · MID-TERM · GROUP 24

Auracle

Not a playlist. A station. It builds your session — and hosts it.

München, 01. Juni 2026

THE IDEA

A radio station built around the moment

Tell Auracle **how you feel** and **what you're doing**. It picks the music, puts it in order, writes what the host says between tracks, and plays it all back. You press *play* once.

Streaming apps are good at handing you a list of songs. What they don't give you is a sense of occasion — a shape to the listening, and someone talking you through it.

THREE EXAMPLE SESSIONS

YOU SAY
tired · studying late

→ YOU GET
Quiet Hours, vol. 3
45 min · winds down

YOU SAY
hyped · gym

→ YOU GET
Brick Heat
22 min · stays high

YOU SAY
sunday morning · cooking

→ YOU GET
Slow Brew
35 min · eases up

WHAT'S NEW

Four things that make it more than a chatbot with music

The language model is one part of this. The product is how the four pieces below fit together.

01 — MEMORY

It learns your taste on its own

You never fill out a music survey. It watches what you skip, what you finish, and when you listen, and uses that the next time you open it.

remembers across sessions

02 — SESSION FLOW

The order has a shape

Songs aren't just ranked. They're arranged into an arc — ease in, build to a peak, then come back down — and the tempo doesn't jump more than about 15 BPM between tracks.

a curve, not a list

03 — OUR OWN MUSIC

We generate the tracks ourselves

An offline step creates the instrumental music with AI and tags every track by mood, scene and energy. Nothing to license while the app is running.

instrumental · pre-made · tagged

04 — A HOST

Someone actually talks

Instead of silent gaps, an AI voice opens the session and links the songs together — with no pause before or after the music.

opening · segues · outro

HOW IT'S BUILT

Three layers

LAYER 1 Listener	What the user sees A phone web app: pick a mood, hear the result, tap like or skip.
LAYER 2 Brain	Where the AI runs find the tracks, order them, write the host lines, make the voice.
LAYER 3 Store	Where everything is kept The generated music with its tags, and each user's saved preferences.

At runtime the **Brain** pulls candidates from the **Store**, shapes the session, and streams voice and music to the **Listener** — and every like or skip flows back into memory.

THE PLAN

From mid-term to final

Build through June. Test in early July. Final presentation with a working demo on **28 July**.

CLOSING

„Auracle gives a listening session a shape and a voice. All the user does is press play.“

Architecture is set · the build starts this week · working demo at the final on 28 July. — Questions?
